Problem 1	2
Problem 2	2
Problem 3	2
Problem 4	2
Problem 5	3

Problem 1

Given $f(x) = \frac{1}{(1+x^2)^2}$ find $\widehat{f}(\xi)$. Prove that $\widehat{f} \in C^2$. You can use the following fact that follows from complex integration

$$\int_{-\infty}^{\infty} \frac{\cos(ax)}{x^2 + b^2} dx = \frac{\pi}{b} e^{-ab}, \quad a, b > 0.$$

Proof.

□

Problem 2

- (a) Prove that if $f, g \in \mathcal{S}(\mathbb{R}^n)$ (the Schwartz class of functions) then $f * g \in \mathcal{S}(\mathbb{R}^n)$.
 (b) Find explicitly $\Psi = \widehat{|x|^2} \in \mathcal{S}'(\mathbb{R}^n)$.

Proof.

□

Problem 3

Let $0 < \alpha < \frac{n}{2}$.

- (a) Prove that $|x|^{-n+\alpha}$ defines a tempered distribution.
 (b) Prove that

$$\widehat{|x|^{-n+\alpha}}(\xi) = c_{n,\alpha} |\xi|^{-\alpha}.$$

Observe that $|x|^{-n+\alpha} \chi_{\{|x| \leq 1\}} \in L^1(\mathbb{R})$ and $|x|^{-n+\alpha} \chi_{\{|x| > 1\}} \in L^2(\mathbb{R})$. Thus $\widehat{|x|^{-n+\alpha}}(\xi)$ is a function. Show that $\widehat{|x|^{-n+\alpha}}(\xi)$ is radial and homogeneous of order $-\alpha$.

Define the *Hilbert transform* $\mathcal{H}(\phi)$ of a function $\phi \in \mathcal{S}(\mathbb{R})$ by

$$\mathcal{H}(\phi) = \frac{1}{\pi} \text{p.v.} \left(\frac{1}{x} \right) * \phi,$$

where

$$\text{p.v.} \left(\frac{1}{x} \right) (\phi) = \lim_{\varepsilon \rightarrow 0} \int_{\varepsilon < |x| < \frac{1}{\varepsilon}} \frac{\phi(x)}{x} dx.$$

Proof.

□

Problem 4

If $\phi \in \mathcal{S}(\mathbb{R})$, prove that $\mathcal{H}(\phi) \in L^1(\mathbb{R})$ if and only if $\widehat{\phi}(0) = 0$.

Proof.

□

Problem 5

Prove the following identities:

(a) $\mathcal{H}(fg) = \mathcal{H}(f)g + f\mathcal{H}(g) + \mathcal{H}(\mathcal{H}(f)\mathcal{H}(g)).$

(b) $\mathcal{H}(\mathcal{X}_{(-1,1)}) = \frac{1}{\pi} \log \left| \frac{x+1}{x-1} \right|.$

Proof. (a) First note that since

$$\widehat{\text{p.v.}\left(\frac{1}{x}\right)} = -i\pi \text{sgn}(\xi),$$

then the Fourier transform of the Hilbert transform is

$$\widehat{\mathcal{H}(\phi)} = \frac{1}{\pi} \widehat{\text{p.v.}\left(\frac{1}{x}\right)} \hat{\phi} = -i \text{sgn}(\xi) \hat{\phi}.$$

Also note that

$$\text{sgn}(x-y)\text{sgn}(y) = \text{sgn}(x)\text{sgn}(y) + \text{sgn}(x-y)\text{sgn}(x) - 1$$

Finally,

$$\begin{aligned} \mathcal{H}(f)g + f\mathcal{H}(g) + \mathcal{H}(\mathcal{H}(f)\mathcal{H}(g)) &= [-i \text{sgn} \hat{f}] * \hat{g} + [-i \text{sgn} \hat{g}] * \hat{f} - i \text{sgn} [\widehat{\mathcal{H}(f)\mathcal{H}(g)}] \\ &= [-i \text{sgn} \hat{f}] * \hat{g} + [-i \text{sgn} \hat{g}] * \hat{f} - i \text{sgn} [(-i \text{sgn} \hat{f}) * (-i \text{sgn} \hat{g})] \\ &= \int_{\mathbb{R}} -i \text{sgn}(\xi - y) \hat{f}(\xi - y) \hat{g}(y) dy + \int_{\mathbb{R}} -i \text{sgn}(y) \hat{g}(y) \hat{f}(\xi - y) dy \\ &\quad - i \text{sgn}(\xi) \int_{\mathbb{R}} -\text{sgn}(\xi - y) \hat{f}(\xi - y) \text{sgn}(y) \hat{g}(y) dy \\ &= \int_{\mathbb{R}} -i \text{sgn}(\xi - y) \hat{f}(\xi - y) \hat{g}(y) dy + \int_{\mathbb{R}} -i \text{sgn}(y) \hat{g}(y) \hat{f}(\xi - y) dy \\ &\quad - i \text{sgn}(\xi) \int_{\mathbb{R}} \hat{f}(\xi - y) \hat{g}(y) dy \\ &\quad + i \text{sgn}(\xi) \int_{\mathbb{R}} \text{sgn}(\xi) \text{sgn}(y) \hat{f}(\xi - y) \hat{g}(y) dy \\ &\quad + i \text{sgn}(\xi) \int_{\mathbb{R}} \text{sgn}(\xi - y) \text{sgn}(\xi) \hat{f}(\xi - y) \hat{g}(y) dy \\ &= \int_{\mathbb{R}} -i \text{sgn}(\xi - y) \hat{f}(\xi - y) \hat{g}(y) dy + \int_{\mathbb{R}} -i \text{sgn}(y) \hat{g}(y) \hat{f}(\xi - y) dy \\ &\quad - i \int_{\mathbb{R}} \text{sgn}(\xi) \hat{f}(\xi - y) \hat{g}(y) dy \\ &\quad + i \int_{\mathbb{R}} \text{sgn}(y) \hat{f}(\xi - y) \hat{g}(y) dy \\ &\quad + i \int_{\mathbb{R}} \text{sgn}(\xi - y) \hat{f}(\xi - y) \hat{g}(y) dy \\ &= -i \text{sgn}(\xi) \int_{\mathbb{R}} \hat{f}(\xi - y) \hat{g}(y) dy \\ &= -i \text{sgn}(\xi) \hat{f} * \hat{g} = -i \text{sgn}(\xi) \widehat{fg} = \widehat{\mathcal{H}(fg)} \end{aligned}$$

Since the Fourier transform is an isomorphism, the identity holds since we can take the inverse Fourier transform of both sides.

(b)

$$\begin{aligned}
\mathcal{H}(\mathcal{K}_{(-1,1)}) &= \frac{1}{\pi} \lim_{\varepsilon \rightarrow 0} \int_{\varepsilon < |y| < \frac{1}{\varepsilon}} \frac{\mathcal{K}_{(-1,1)}(y)}{x-y} dy \\
&= \frac{1}{\pi} \lim_{\varepsilon \rightarrow 0} \int_{\varepsilon < |y| < 1} \frac{1}{x-y} dy \\
&= \frac{1}{\pi} \left[\lim_{\varepsilon \rightarrow 0} \left[\int_{\varepsilon}^1 \frac{1}{x-y} dy + \int_{-1}^{-\varepsilon} \frac{1}{x-y} dy \right] \right] \\
&= \frac{1}{\pi} \left[\lim_{\varepsilon \rightarrow 0} \left[\log|x-y| \Big|_{\varepsilon}^1 + \log|x-y| \Big|_{-1}^{-\varepsilon} \right] \right] \\
&= \frac{1}{\pi} \left[\lim_{\varepsilon \rightarrow 0} [\log|x-1| - \log|x-\varepsilon| + \log|x+\varepsilon| - \log|x+1|] \right] \\
&= \frac{1}{\pi} \log \left| \frac{x-1}{x+1} \right|
\end{aligned}$$
