1 A Short Introduction to L^p Spaces

1.1 Three Pillars of Analysis

1.1.1. **Monotone Convergence Theorem** - If a sequence of non-negative functions is increasing, we can pull the limit through an integral.

 $\lim_{k} \int f_k = \int \lim_{k} f_k.$

1.1.2. **Fatou's Lemma** - For a sequence of non-negative functions, the integral of the lim inf is less than or equal to the lim inf of the integral.

 $\int \liminf_{k} f_k \le \liminf_{k} \int f_k.$

- (1.1.2.1) Example: $f_k = k\mathcal{X}_{\left(0,\frac{1}{k}\right)}$. $\int_0^1 f_k = 1$ for all $k \implies \liminf_k \int_0^1 f_k = \liminf_k 1 = 1$. But since $f_k \to 0$ pointwise a.e., $\liminf_k f_k(x) = 0 \implies \int_0^1 \liminf_k f(x) dx = 0$.
- 1.1.3. **Dominated Convergence Theorem** If a sequence converges pointwise almost everywhere and is dominated, then it converges in norm to its pointwise limit.

$$\lim_{k} \int f_k = \int \lim_{k} f_k = \int f.$$
$$\lim_{k} ||f_k - f||_1 = 0.$$

1.2 Integrals over Product Spaces

- 1.2.1. **Fubini's Theorem** If a function is integrable on a product space, then the integral over the product space is equal to both iterated integrals.
 - (1.2.1.1) Iterated integrals may exist without the existence of the integral over the product space.
- 1.2.2. **Semi-converse of Fubini's Theorem** If an iterated integral exists of the *absolute value* of a function on a prodct space, then the integral of the product space is equal to both iterated integrals.
- 1.2.3. **Tonelli's Theorem** If a function is non-negative and measurable on a product space, then the integral over the product space is equal to both iterated integrals.

1.3 L^p Spaces

1.3.1. Convexity is a thing.

$$x^{\lambda} \le (1 - \lambda) + \lambda x \qquad \forall \lambda \in (0, 1).$$
$$a^{\lambda} b^{1 - \lambda} \le \lambda a + (1 - \lambda) b \qquad \forall \lambda \in (0, 1), \qquad \forall a, b \ge 0.$$

1.3.2. **Hölder's Inequality** - For conjugate exponents p and q, the 1-norm of a product of L^p and L^q functions is finite, and the 1-norm of the product is less than or equal to the product of the norms of the original functions.

$$||fg||_1 \le ||f||_p ||g||_q$$

.

1.3.3. Interpolation Inequality - For $1 \le r \le s \le t \le \infty$, if u is in L^r and L^t , then u is in L^s and the s-norm is less than of equal to the product of the r- and t-norms raised to the appropriate power.

$$||u||_{s} \le ||u||_{r}^{a} ||u||_{t}^{1-a}$$
 where $\frac{1}{s} = \frac{a}{r} + \frac{1-a}{t}$.

1.3.4. Minkowski's Inequality - For functions in L^p , the norm of their sum is less than or equal to the sum of their norms.

$$||f + g||_p \le ||f||_p + ||g||_p.$$

- 1.3.5. L^p is a normed linear space.
- 1.3.6. L^p is a Banach Space (a complete (Cauchy sequences converge) normed linear space). Steps of the proof:
 - (1.3.6.1) Construct the Cauchy sequence.
 - (1.3.6.2) Construct a monotone sequence from the Cauchy sequence.
 - (1.3.6.3) Use Mikowski's Inequality and Triangle Inequality to show the sequence is uniformly bounded.
 - (1.3.6.4) Show pointwise convergence of Cauchy sequence using Triangle Inequality.
 - (1.3.6.5) Use dominated Convergence Theorem to show norm convergence of Cauchy sequence.
- 1.3.7. **Pointwise convergence implies a double implication** If a sequence of functions converge pointwise, then their norms converge if and only if they converge in norm.

$$f_k \to f$$
 pointwise \Longrightarrow $\left[\|f_k - f\|_p \to 0 \iff \|f_k\|_p \to \|f\|_p \right].$

1.3.8. L^p Comparisons - For $1 \le r \le s \le t \le \infty$, if a function in L^s can be written as the sum of functions in L^r and L^t .

$$L^s \subset L^r + L^t$$
.

1.3.9. L^p Comparison for Finite Spaces - For finite measure spaces, a function in L^q is also in L^p for all q > p.

$$L^q \subset L^p$$
.

- 1.3.10. Approximation of L^p $(p < \infty)$ by Simple Functions The set of Simple Functions are dense in L^p .
- 1.3.11. Approximation of L^p ($p < \infty$) by Continuous Functions For bounded measure spaces, the set of continuous functions is dense in L^p .
- 1.3.12. Approximation of L_{loc}^p by Smooth Functions For a function f in L_{loc}^p , its mollified functions:
 - (1.3.12.1) are infinitely differentiable,
 - (1.3.12.2) converge pointwise to f,
 - (1.3.12.3) converge uniformly to f on compact subsets of the space (given f is continuous), and
 - (1.3.12.4) converge to f in L_{loc}^p .

1.4 Convolutions and (in general) Integral Operators

1.4.1. Boundedness of Integral Operators - An integral operator has bounded norm (and is hence continuous) if both of the absolute iterated integrals of its kernel are bounded (say by C_1 and C_2).

$$||K||_{\mathcal{B}(L^p(\mathbb{R}^n))} \le C_1^{\frac{1}{p}} C_2^{\frac{1}{q}}.$$

1.4.2. Cauchy-Young Inequality - If p and q are conjugate exponents, then for all nonnegative a and b,

$$ab \le \frac{a^p}{p} + \frac{b^q}{q}.$$

(1.4.2.1) Cauchy-Young Inequality with δ - If p and q are conjugate exponents, the for all nonnegative a and b.

$$ab \le \delta a^p + C_{\delta} b^q, \qquad \delta > 0, \qquad C_{\delta} = (\delta p)^{-\frac{q}{p}} q^{-1}.$$

1.4.3. Simple Version of Young's Inequality - For L^1 function k and L^p function f, the p-norm of their convolution is less than or equal to the product of their respective norms.

$$||k * f||_p \le ||k||_1 ||f||_p.$$

1.4.4. (More general) Young's Inequality for Convolution - For L^p function k and L^q function f, the r-norm of their convolution is bounded by the product of their respective norms, given $1 + \frac{1}{r} = \frac{1}{p} + \frac{1}{q}$.

$$||k*f||_r \le ||k||_p ||f||_q, \qquad 1 + \frac{1}{r} = \frac{1}{p} + \frac{1}{q}.$$

1.5 The Dual Space and Weak Topology

1.5.1. Norm of an Integral Operator is the Norm of its Kernel - For conjugate exponents p and q, integration of an L^p function against an L^q function is a continuous linear functional on L^p and the operator norm is equal to the norm of the L^q function.

$$F_g(f) = \int fg$$
 and $\|F_g\|_{\text{op}} = \|g\|_q$.

1.5.2. Riesz Representation Theorem (1 - For conjugate exponents <math>p and q, every bounded (continuous) linear functional on L^p can be represented as an integral operator whose kernel is in L^q .

$$\phi \in (L^p)^* \implies \exists g \in L^q \text{ such that } \phi(f) = \int fg \ \forall f \in L^p.$$

- 1.5.3. Reflexivity of L^p (1 < $p < \infty$) The dual space of the dual space of L^p is isomorphic to L^p .
- 1.5.4. Radon-Nikodym Theorem If μ and ν are two finite measures on a measure space where ν is absolutely continuous with respect to μ , then there exists an L^1 function h to change the measure of integration as follows:

$$\int F d\nu = \int F h d\mu$$
 for every positive measurable function F .

1.5.5. Converse to Hölder's Inequality - For finite measure spaces, if a product of a measurable function and any simple function is L^1 , and if the supremum of the L^1 -norm of the product (for simple functions of L^p -norm 1) is finite, then the measurable function is in L^q and its L^q -norm is equal to that supremum.

$$M(g) = \sup_{\|f\|_{p} = 1} \left\{ \left| \int_{\Omega} f g \mathrm{d} \mu \right| \ : \ f \text{ is a simple function} \right\} < \infty \quad \Longrightarrow \quad g \in L^{q}(\Omega) \ \text{ and } \ \|g\|_{q} = M(g).$$

- 1.5.6. Alaoglu's Lemma The closed unit ball in the dual of a Banach space is compact in the weak-* topology.
- 1.5.7. Weak Compactness for $L^p(\Omega)$ for $1 Every bounded sequence in <math>L^p$ has a weakly convergent subsequence.
- 1.5.8. Weak-* compactness for L^{∞} Every bounded sequence in L^{∞} has a weak* convergent subsequence.
- 1.5.9. Convergence implies weak convergence Convergent sequences in L^p are weakly convergent.
- 1.5.10. Weak Limits have Bounded Norms The L^p norm of a weak limit is bounded by the lim inf of the L^p norms of its sequence.
- 1.5.11. Weakly convergent Sequences are bounded Weakly convergent L^p sequences have bounded L^p norms.
- 1.5.12. **Egoroff's Theorem** For pointwise convergent sequences on finite domains, there exist arbitrarily small (positive measure) subsets such that the sequence converges uniformly on its complement.

$$\forall \varepsilon < 0, \ \exists E \subset \Omega \text{ with } |E| < \varepsilon \text{ such that } f_k \to f \text{ uniformly on } \Omega \setminus E.$$

1.5.13. **Theorem 1.67** - Almost everywhere convergence of a bounded (in L^p) sequence in a bounded domain implies weak convergence for 1 .

$$\Omega \subset \mathbb{R}^n$$
 bounded, $\sup_k \|f_k\|_p \le M < \infty$, and $f_k \to f$ a.e. $\Longrightarrow f_k \rightharpoonup f$.

1.5.14. Weak and Strong Convergence Imply Strong Integral Convergence - If $u_k \rightharpoonup u$ and $v_k \to v$ in $L^p(\Omega)$, then

$$\int_{\Omega} u_k v_k \mathrm{d}x \to \int_{\Omega} u v \mathrm{d}x$$

1.5.15. Weak Convergence Sometimes Implies Strong Convergence - Suppose $u_k \rightharpoonup u$ in $L^p(\Omega)$. If $||u||_p = \lim ||u_k||_p$, the $u_k \to u$ in $L^p(\Omega)$.

2 Sobolev Spaces and the Fourier Transform

- **2.1** Sobolev Spaces $W^{k,p}$ for Integers $k \geq 0$
- 2.1.1. Divergence Theorem Let $w: \overline{\Omega} \subset \mathbb{R}^n \to \mathbb{R}^n$. If $\partial \Omega$ is the graph of a Lipschitz function, then

$$\int_{\Omega} \nabla \cdot w dx = \int_{\partial \Omega} w \cdot N dS$$

where N is the outward-facing normal vector.

2.1.2. Multi-Dimensional Version of Integration by Parts - Suppose $g, h : \Omega \to \mathbb{R}$. Then

$$\int_{\Omega} gh_{x_i} dx = \int_{\partial \Omega} gh N^i dS - \int_{\Omega} g_{x_i} h dx$$

where g_{x_i} and h_{x_i} are the i^{th} partial derivatives of g and h, respectively, and N^i is the i^{th} component of the outward-facing normal vector.

2.1.3. Green's First Identity - Suppose $u \in \mathcal{C}^2(\overline{\Omega})$ and $v \in \mathcal{C}^1(\overline{\Omega})$. Then

$$\int_{\Omega} \nabla v \cdot \nabla u dx = \int_{\Omega} v \nabla^2 u dx = \int_{\Omega} \nabla \cdot (v \nabla u) dx = \int_{\partial \Omega} v \frac{\partial u}{\partial N} dX.$$

where
$$\nabla^2 = \frac{\partial^2}{\partial x_i^2} + \dots + \frac{\partial^2}{\partial x_n^2}$$
.

2.1.4. Green's Second Identity - Suppose both u and v are in $C^2(\overline{\Omega})$. Then

$$\int_{\Omega} (v\nabla^2 u - u\nabla^2 v) dx = \int_{\partial\Omega} \left[v \frac{\partial u}{\partial N} - u \frac{\partial v}{\partial N} \right] dS.$$

2.1.5. Liebnitz Rule (Product Rule) - Suppose $u \in W^{k,p}$ and ϕ is a test function. Then $\phi u \in W^{k,p}$ and

$$D^{\alpha}(\phi u) = \sum_{|\beta| < |\alpha|} {\alpha \choose \beta} D^{\alpha} \phi D^{\alpha - \beta} u$$

- 2.1.6. Sobolev Spaces are Banach Spaces $W^{k,p}$ is a Banach Space.
- 2.1.7. Sobolev Embedding in 2D Suppose ϕ is a test function. Then it is absolutely bounded by a constant multiple of its norm in $W^{k,p}(\mathbb{R}^2)$.

$$\max_{x \in \mathbb{R}^2} |u(x)| \le C ||u||_{W^{k,p}(\mathbb{R}^2)}$$

2.1.8. Local Approximation of Sobolev Functions by Smooth Functions - For nonnegative k and finite p, and for $u \in W^{k,p}$,

- (2.1.8.1) $u^{\varepsilon} = \eta_{\varepsilon} * u$ is infinitely continuous (not necessarily compactly supported) on Ω_{ε} , and (2.1.8.2) $u^{\varepsilon} \to u$ in $W_{loc}^{k,p}$
- 2.1.9. Global Approximaton of Sobolev Functions by Smooth Functions For open and bounded Ω and for finite p, infinitely smooth Sobolev functions are dense in Sobolev Space.

$$\mathcal{C}^{\infty}(\Omega) \cap W^{k,p}(\Omega)$$
 is dense in $W^{k,p}(\Omega)$ with respect to the $W^{k,p}$ norm.

2.1.10. Global Approximation of Sobolev Functions on the Closure of the Domain - For smooth, bounded, open subsets of \mathbb{R}^n , Sobolev functions can be approximated by infinitely smooth functions on the closure of the domain.

$$\mathcal{C}^{\infty}(\overline{\Omega})$$
 is dense in $W^{k,p}(\Omega)$ with respect to the $W^{k,p}$ norm.

2.1.11. Morrey's Inequality - Sobolev functions on a ball have bounded differences. Denote $B_r \subset \mathbb{R}^n$ as a ball of radius r and let n .

$$|u(x) - u(y)| \le C|x - y|^{1 - \frac{n}{p}} ||Du||_{L^p(B_r)}$$

2.1.12. Sobolev Embedding for k = 1 - The $C^{0,1-\frac{n}{p}}(\mathbb{R}^n)$ norm (Hölder Space norm) of a Sobolev function is bounded by a constant multiple (dependent on p and n) of the $W^{1,p}(\mathbb{R}^n)$ norm.

$$||u||_{\mathcal{C}^{0,1-\frac{n}{p}}(\mathbb{R}^n)} \le C||u||_{W^{1,p}(\mathbb{R}^n)}$$

2.1.13. Sobolev Embedding for kp > n - The Hölder Space norm of a Sobolev function is bounded by a constant multiple (dependent on k, p, and n) of the Sobolev norm.

$$\|u\|_{\mathcal{C}^{k-\left[\frac{n}{p}\right]-1,\gamma}(\mathbb{R}^n)} \leq C\|u\|_{W^{k,p}(\mathbb{R}^n)} \quad \text{where} \quad \gamma = \begin{cases} \left[\frac{n}{p}\right] + 1 - \frac{n}{p} & \text{if } \frac{n}{p} \notin \mathbb{N}, \\ \text{any } \alpha \in \mathbb{R} \cap (0,1) & \text{if } \frac{n}{p} \in \mathbb{N}. \end{cases}$$

- 2.1.14. Almost-Everywhere Differentiability For n , local Sobolev functions are almost-everywhere differentiable and its gradient and weak gradient agree almost everywhere.
- 2.1.15. **Gagliardo-Nirenberg-Sobolev Inequality** For $1 \le p < n$, set $p^* = \frac{np}{n-p}$. Then the L^{p^*} norm of a Sobolev function is bounded by a constant multiple (dependent on n and p) of the L^p norm of its derivative.

$$||u||_{L^{p^*}(\mathbb{R}^n)} \le C||Du||_{L^p(\mathbb{R}^n)}.$$
